
Ledger invariant harness

34 tests, most of them negative: a fixture builds a coherent purchase, then corrupts one column and asserts the right invariant fires

Price sweep

every value from 1 to 300, both stages and both splits, reconciled exactly

Validated by sabotage, not by passing: removing the completed-status filter from the earnings query fails exactly the pending-payout test, and dropping preview_unlock from the debit list fails 7. That exercise found a real coverage gap (nothing pinned the grant type filter), which was then closed.
